- ④ Modal logic

## Basic definitions and examples

# Definition

$B : \mathbb{C} \rightarrow \mathbb{C}$  a functor,  $S$  an object in  $\mathbb{C}$

# Definition

$B : \mathbb{C} \rightarrow \mathbb{C}$  a functor,  $S$  an object in  $\mathbb{C}$

$$\sigma : S \rightarrow BS$$

# Definition

$B : \mathbb{C} \rightarrow \mathbb{C}$  a functor,  $S$  an object in  $\mathbb{C}$

$$\sigma : S \rightarrow BS$$

## Morphisms

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow \sigma & & \downarrow \tau \\ BS & \xrightarrow{Bf} & BS' \end{array}$$

# Definition

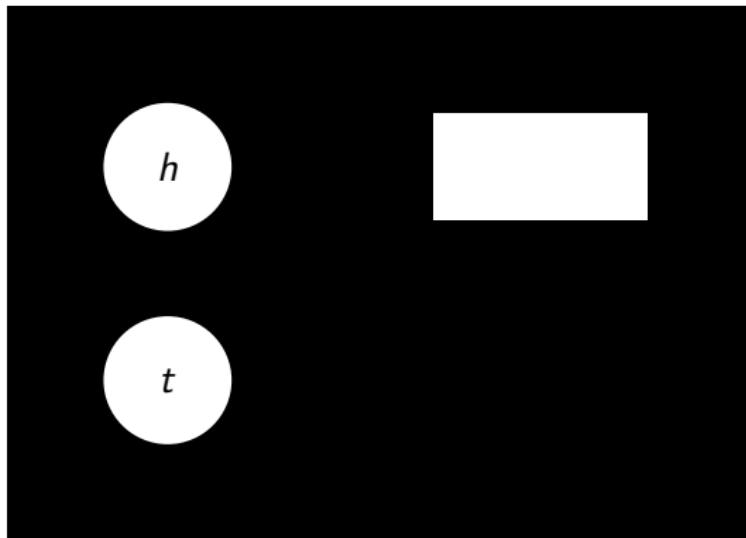

$B : \text{Set} \rightarrow \text{Set}$  a functor,  $S$  a set of states

$$\sigma : S \rightarrow BS$$

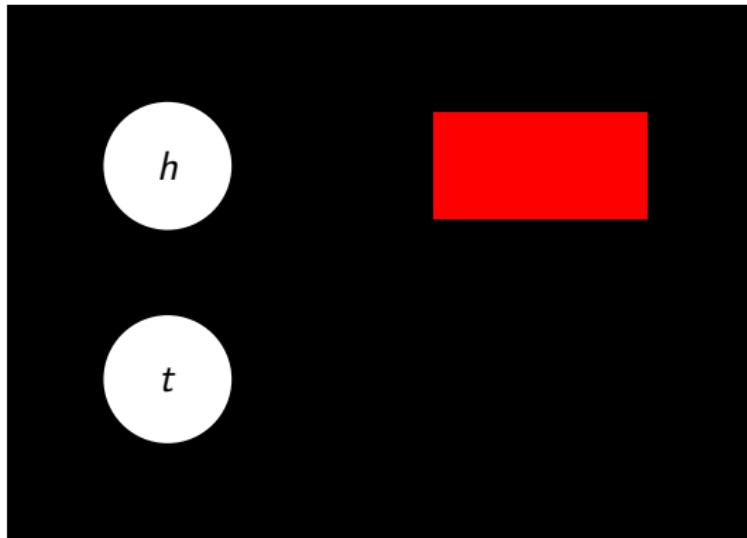

## Morphisms

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow \sigma & & \downarrow \tau \\ BS & \xrightarrow{Bf} & BS' \end{array}$$

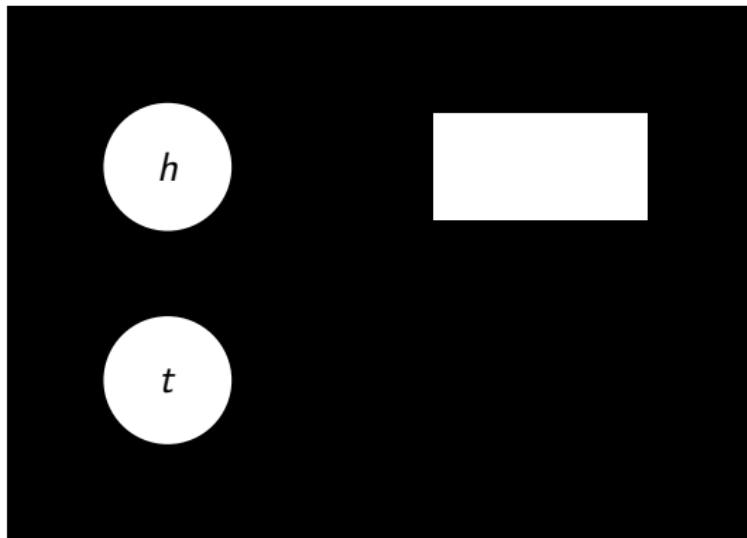

# Black box machines

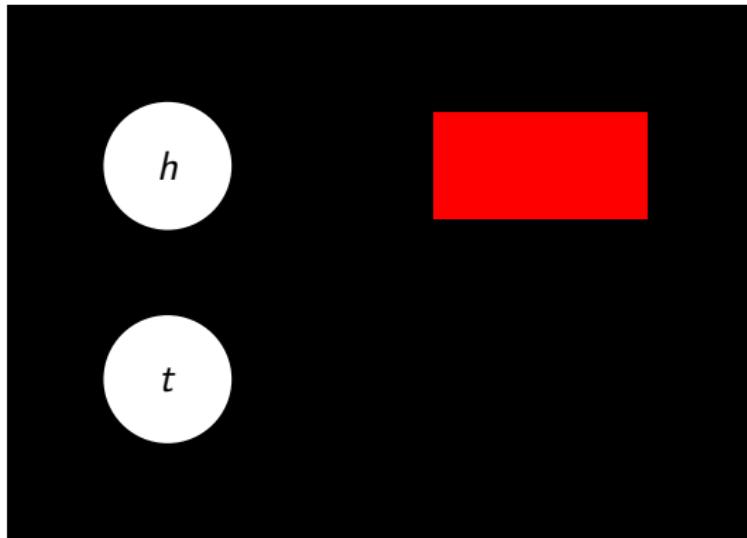

# Black box machines

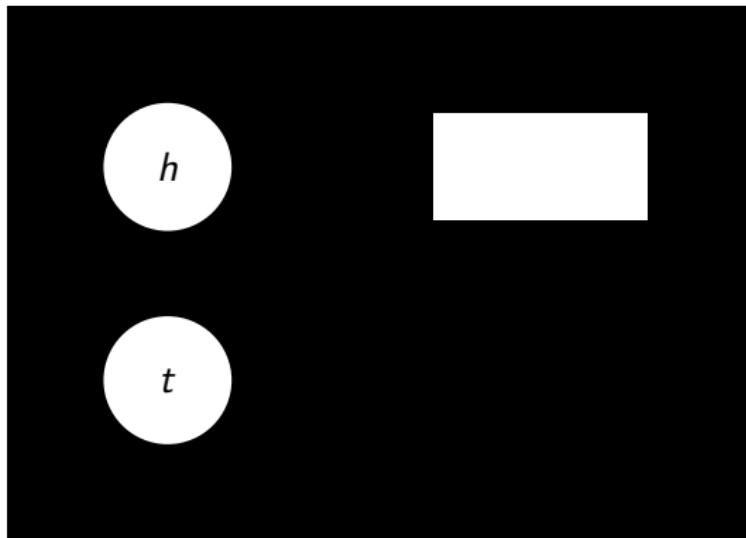

# Black box machines

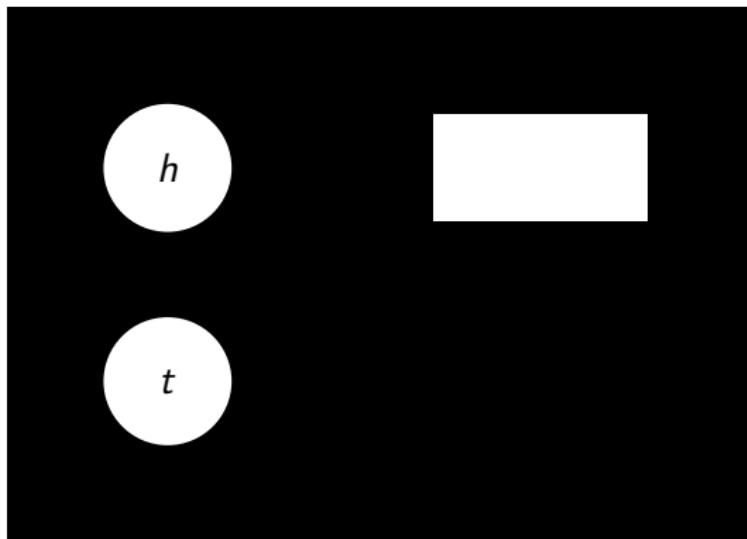

# Black box machines

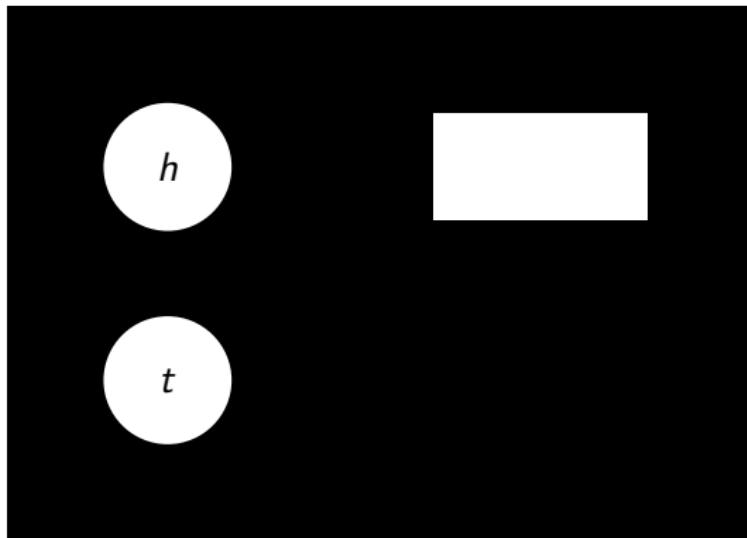

# Black box machines

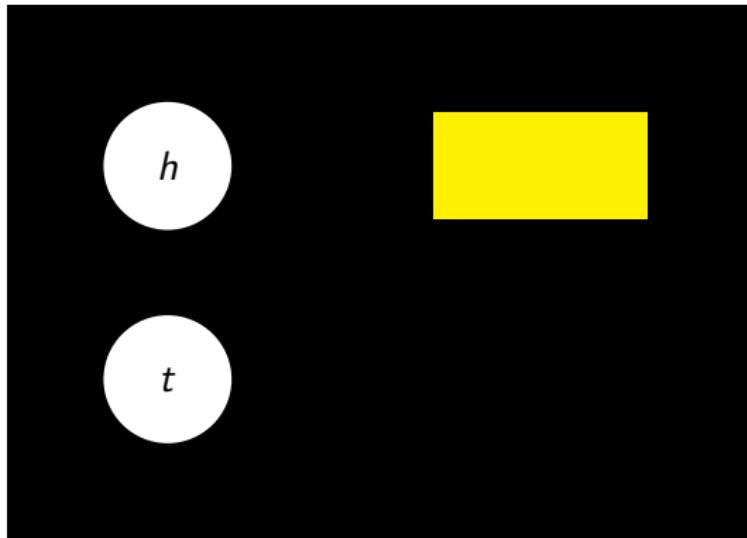

# Black box machines

# Black box machines

# Black box machines

# Black box machines

$C$  a set of colors

$$h : S \rightarrow C, \quad t : S \rightarrow S$$

# Black box machines

$C$  a set of colors

$$h : S \rightarrow C, \quad t : S \rightarrow S \quad \iff \quad \langle h, t \rangle : S \rightarrow C \times S$$

# Black box machines

$C$  a set of colors

$$h : S \rightarrow C, \quad t : S \rightarrow S \quad \iff \quad \langle h, t \rangle : S \rightarrow C \times S$$

Black box machines are  $C \times \text{id}$ -coalgebras

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A subset  $F \subseteq S$ , a function  $S \times A \rightarrow S$ .

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A **function**  $\alpha : S \rightarrow \{0, 1\}$ , a function  $S \times A \rightarrow S$ .

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A function  $\alpha : S \rightarrow \{0, 1\}$ , a **function**  $\sigma : S \rightarrow S^A$ .

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A function  $\langle \alpha, \sigma \rangle : S \rightarrow \{0, 1\} \times S^A$ .

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A function  $\langle \alpha, \sigma \rangle : S \rightarrow \{0, 1\} \times S^A$ .

A deterministic automaton is a  $2 \times \text{id}^A$ -coalgebra

# Deterministic automata

$A$  an alphabet,  $S$  a set of states.

A function  $\langle \alpha, \sigma \rangle : S \rightarrow \{0, 1\} \times P(S)^A$

A nondeterministic automaton is a  $2 \times P(\text{id})^A$ -coalgebra

# Final coalgebras and corecursion

# Streams

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;
- tail : Streams  $\rightarrow$  Streams given by  $(c_0, c_1, c_2, \dots) \mapsto (c_1, c_2, c_3, \dots)$ .

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;
- tail : Streams  $\rightarrow$  Streams given by  $(c_0, c_1, c_2, \dots) \mapsto (c_1, c_2, c_3, \dots)$ .

So Streams is a BBM.

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;
- tail : Streams  $\rightarrow$  Streams given by  $(c_0, c_1, c_2, \dots) \mapsto (c_1, c_2, c_3, \dots)$ .

So Streams is a BBM.

## Proposition

For any BBM  $\sigma = \langle h, t \rangle : S \rightarrow C \times S$ , there is a *unique* coalgebra morphism  $\text{beh}_\sigma : S \rightarrow \text{Streams}$ .

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;
- tail : Streams  $\rightarrow$  Streams given by  $(c_0, c_1, c_2, \dots) \mapsto (c_1, c_2, c_3, \dots)$ .

So Streams is a BBM.

## Proposition

For any BBM  $\sigma = \langle h, t \rangle : S \rightarrow C \times S$ , there is a *unique* coalgebra morphism  $\text{beh}_\sigma : S \rightarrow \text{Streams}$ .

## Proof.

The only possible map is  $\text{beh}_\sigma(s) = (h(s), ht(s), htt(s), htts(s), \dots)$ . □

# Streams

A  $C$ -stream is a function  $s : \mathbb{N} \rightarrow C$ .

Write Streams for the set of  $C$ -streams. We get some natural functions:

- head : Streams  $\rightarrow C$  given by  $(c_0, c_1, c_2, \dots) \mapsto c_0$ ;
- tail : Streams  $\rightarrow$  Streams given by  $(c_0, c_1, c_2, \dots) \mapsto (c_1, c_2, c_3, \dots)$ .

So Streams is a BBM.

## Proposition

Streams is final in the category of  $C \times \text{id}$ -coalgebras

## Proof.

The only possible map is  $\text{beh}_\sigma(s) = (h(s), ht(s), htt(s), httx(s), \dots)$ . □

# Languages

# Languages

An  $A$ -language is a set of words over  $A$ .

# Languages

An  $A$ -language is a set of words over  $A$ .

Write  $\text{Langs}$  for the set of  $A$ -languages. We get some natural functions:

# Languages

An  $A$ -language is a set of words over  $A$ .

Write  $\text{Langs}$  for the set of  $A$ -languages. We get some natural functions:

- $\text{acc} : \text{Langs} \rightarrow \{0, 1\}$  given by  $\text{acc}(L) = 1$  iff  $\epsilon \in L$ ;

# Languages

An  $A$ -language is a set of words over  $A$ .

Write  $\text{Langs}$  for the set of  $A$ -languages. We get some natural functions:

- $\text{acc} : \text{Langs} \rightarrow \{0, 1\}$  given by  $\text{acc}(L) = 1$  iff  $\epsilon \in L$ ;
- $\delta : \text{Langs} \rightarrow \text{Langs}^A$  given by  $\delta(L, a) := \{w \mid aw \in L\}$ .

# Languages

An  $A$ -language is a set of words over  $A$ .

Write  $\text{Langs}$  for the set of  $A$ -languages. We get some natural functions:

- $\text{acc} : \text{Langs} \rightarrow \{0, 1\}$  given by  $\text{acc}(L) = 1$  iff  $\epsilon \in L$ ;
- $\delta : \text{Langs} \rightarrow \text{Langs}^A$  given by  $\delta(L, a) := \{w \mid aw \in L\}$ .

So  $\text{Langs}$  is a deterministic automaton.

# Languages

An  $A$ -language is a set of words over  $A$ .

Write  $\text{Langs}$  for the set of  $A$ -languages. We get some natural functions:

- $\text{acc} : \text{Langs} \rightarrow \{0, 1\}$  given by  $\text{acc}(L) = 1$  iff  $\epsilon \in L$ ;
- $\delta : \text{Langs} \rightarrow \text{Langs}^A$  given by  $\delta(L, a) := \{w \mid aw \in L\}$ .

So  $\text{Langs}$  is a deterministic automaton.

## Proposition

$\text{Langs}$  is the final  $2 \times \text{id}^A$ -coalgebra.

# Corecursion

# Corecursion

---

```
interleave :: (Stream a, Stream a) -> Stream a
head $ interleave (s0, s1) = head s0
tail $ interleave (s0, s1) = interleave (s1, tail s0)
```

---

# Corecursion

---

```
interleave :: (Stream a, Stream a) -> Stream a
head $ interleave (s0, s1) = head s0
tail $ interleave (s0, s1) = interleave (s1, tail s0)
```

---

Why does this work?\*

# Corecursion

---

```
interleave :: (Stream a, Stream a) -> Stream a
head $ interleave (s0, s1) = head s0
tail $ interleave (s0, s1) = interleave (s1, tail s0)
```

---

Why does this work?\*

Define  $\langle h, t \rangle : \text{Streams} \times \text{Streams} \rightarrow C \times (\text{Streams} \times \text{Streams})$  as

- $h(s_0, s_1) = \text{head}(s_0);$
- $t(s_0, s_1) = (s_1, \text{tail}(s_0)).$

# Corecursion

---

```
interleave :: (Stream a, Stream a) -> Stream a
head $ interleave (s0, s1) = head s0
tail $ interleave (s0, s1) = interleave (s1, tail s0)
```

---

Why does this work?\*

Define  $\langle h, t \rangle : \text{Streams} \times \text{Streams} \rightarrow C \times (\text{Streams} \times \text{Streams})$  as

- $h(s_0, s_1) = \text{head}(s_0)$ ;
- $t(s_0, s_1) = (s_1, \text{tail}(s_0))$ .

Then there is a unique coalgebra morphism

$\text{interleave} : \text{Streams} \times \text{Streams} \rightarrow \text{Streams}$ .

# Behavioral equivalence and bisimulation

# Behavioral equivalence

$(S, \sigma), s \simeq (S', \sigma'), s'$  iff there is a cospan

$$\begin{array}{ccc} & (S', \sigma') & \\ & \downarrow g & \\ (S, \sigma) & \xrightarrow{f} & (Z, \zeta) \end{array}$$

with  $f(s) = g(s')$ .

# Behavioral equivalence

$(S, \sigma), s \simeq (S', \sigma'), s'$  iff there is a cospan

$$\begin{array}{ccc} & (S', \sigma') & \\ & \downarrow g & \\ (S, \sigma) & \xrightarrow{f} & (Z, \zeta) \end{array}$$

with  $f(s) = g(s')$ .

Behavioral equivalence is transitive via pushouts.

# Spans

# Spans

$$\begin{array}{ccc} (R, \rho) & \xrightarrow{\pi_2} & (S', \sigma') \\ \downarrow \pi_1 & & \\ (S, \sigma) & & \end{array}$$

# Spans

$$\begin{array}{ccc} (R, \rho) & \xrightarrow{\pi_2} & (S', \sigma') \\ \downarrow \pi_1 & & \\ (S, \sigma) & & \end{array}$$

$(S, \sigma), s \leftrightarrow (S', \sigma'), s'$  if and only if there is a span (as above) and a  $p \in R$  with  $\pi_1(p) = s$  and  $\pi_2(p) = s'$ .

# Spans

$$\begin{array}{ccc} (R, \rho) & \xrightarrow{\pi_2} & (S', \sigma') \\ \downarrow \pi_1 & & \\ (S, \sigma) & & \end{array}$$

$(S, \sigma), s \sqsupseteq (S', \sigma'), s'$  if and only if there is a span (as above) and a  $p \in R$  with  $\pi_1(p) = s$  and  $\pi_2(p) = s'$ .

By taking pushouts, we have

# Spans

$$\begin{array}{ccc} (R, \rho) & \xrightarrow{\pi_2} & (S', \sigma') \\ \downarrow \pi_1 & & \\ (S, \sigma) & & \end{array}$$

$(S, \sigma), s \sqsubseteq (S', \sigma'), s'$  if and only if there is a span (as above) and a  $p \in R$  with  $\pi_1(p) = s$  and  $\pi_2(p) = s'$ .

By taking pushouts, we have

$$s \sqsubseteq s' \implies s \simeq s'$$

# Relations

Take  $R \subseteq S \times S'$ .

# Relations

Take  $R \subseteq S \times S'$ .

$$\begin{array}{ccccc} S & \xleftarrow{\pi_1} & R & \xrightarrow{\pi_2} & S' \\ \downarrow \sigma & & \downarrow \langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle & & \downarrow \sigma' \\ BS & \xleftarrow{\pi_1} & BS \times BS' & \xrightarrow{\pi_2} & BS' \end{array}$$

# Relations

Take  $R \subseteq S \times S'$ .

$$\begin{array}{ccccc} S & \xleftarrow{\pi_1} & R & \xrightarrow{\pi_2} & S' \\ \downarrow \sigma & & BR & \searrow \langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle & \downarrow \sigma' \\ BS & \xleftarrow{\pi_1} & BS \times BS' & \xrightarrow{\pi_2} & BS' \end{array}$$

# Relations

Take  $R \subseteq S \times S'$ .

$$\begin{array}{ccccc} S & \xleftarrow{\pi_1} & R & \xrightarrow{\pi_2} & S' \\ \downarrow \sigma & & BR & \curvearrowright & \downarrow \sigma' \\ BS & \xleftarrow{\pi_1} & BS \times BS' & \xrightarrow{\pi_2} & BS' \end{array}$$

Diagram illustrating the construction of a coalgebra  $BR$  from a relation  $R$  and coalgebras  $S$  and  $S'$ . The top row shows  $S$  and  $S'$  with projections  $\pi_1$  and  $\pi_2$ . The bottom row shows  $BS$  and  $BS'$  with projections  $\pi_1$  and  $\pi_2$ . A curved arrow labeled  $\langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle$  connects  $R$  to  $BS \times BS'$ . A dotted arrow labeled  $\langle B\pi_1, B\pi_2 \rangle$  points from  $R$  to  $BS$ .

# Relations

Take  $R \subseteq S \times S'$ .

$$\begin{array}{ccccc} S & \xleftarrow{\pi_1} & R & \xrightarrow{\pi_2} & S' \\ \downarrow \sigma & & \swarrow BR & \searrow & \downarrow \sigma' \\ BS & \xleftarrow{\pi_1} & BS \times BS' & \xrightarrow{\pi_2} & BS' \end{array}$$

Diagram illustrating the span of relations. The top row shows  $S$  and  $S'$  with projections  $\pi_1: R \rightarrow S$  and  $\pi_2: R \rightarrow S'$ . The bottom row shows the product coalgebra  $BS \times BS'$  with projection  $\pi_1: BS \times BS' \rightarrow BS$  and  $\pi_2: BS \times BS' \rightarrow BS'$ . A curved arrow labeled  $\langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle$  connects the two rows. A dotted arrow labeled  $\langle B\pi_1, B\pi_2 \rangle$  points from the bottom row to the middle column. The label  $BR$  is placed near the dotted arrow.

We get a span if

$$\text{im} \langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle \subseteq \text{im} \langle B\pi_1, B\pi_2 \rangle$$

# Relations

Take  $R \subseteq S \times S'$ .

$$\begin{array}{ccccc} S & \xleftarrow{\pi_1} & R & \xrightarrow{\pi_2} & S' \\ \downarrow \sigma & & \swarrow BR & \curvearrowright & \downarrow \sigma' \\ BS & \xleftarrow{\pi_1} & BS \times BS' & \xrightarrow{\pi_2} & BS' \end{array}$$

Diagram illustrating the construction of a span from a relation  $R$ . The top row shows  $S$  and  $S'$  with projections  $\pi_1: R \rightarrow S$  and  $\pi_2: R \rightarrow S'$ . The bottom row shows the product space  $BS \times BS'$  with projections  $\pi_1: BS \times BS' \rightarrow BS$  and  $\pi_2: BS \times BS' \rightarrow BS'$ . A curved arrow labeled  $\langle \sigma \circ \pi_1, \sigma' \circ \pi_2 \rangle$  connects the two rows. A dotted arrow labeled  $\langle B\pi_1, B\pi_2 \rangle$  points from  $BR$  in the middle to the bottom row.

We get a span if

$$(s, s') \in R \implies \exists p \in BR : B\pi_1(p) = \sigma(s), B\pi_2(p) = \sigma'(s')$$

# Bisimulation

Let  $B$  be a functor. For a relation  $R : X \multimap Y$ , define

$$\overline{B}R = \{(\alpha, \beta) \in BX \times BY \mid \exists p \in BR : \alpha = B\pi_1(p), \beta = B\pi_2(p)\}$$

# Bisimulation

Let  $B$  be a functor. For a relation  $R : X \multimap Y$ , define

$$\overline{B}R = \{(\alpha, \beta) \in BX \times BY \mid \exists p \in BR : \alpha = B\pi_1(p), \beta = B\pi_2(p)\}$$

A relation  $R \subseteq S \times S'$  is a bisimulation if for all  $s, s'$ , we have

$$(s, s') \in R \implies (\sigma(s), \sigma'(s')) \in \overline{B}R$$

# Bisimulation

Let  $B$  be a functor. For a relation  $R : X \multimap Y$ , define

$$\overline{B}R = \{(\alpha, \beta) \in BX \times BY \mid \exists p \in BR : \alpha = B\pi_1(p), \beta = B\pi_2(p)\}$$

A relation  $R \subseteq S \times S'$  is a bisimulation if for all  $s, s'$ , we have

$$(s, s') \in R \implies (\sigma(s), \sigma'(s')) \in \overline{B}R$$

Bisimilar states are behaviorally equivalent.

# Bisimulation

Let  $B$  be a functor. For a relation  $R : X \multimap Y$ , define

$$\overline{B}R = \{(\alpha, \beta) \in BX \times BY \mid \exists p \in BR : \alpha = B\pi_1(p), \beta = B\pi_2(p)\}$$

A relation  $R \subseteq S \times S'$  is a bisimulation if for all  $s, s'$ , we have

$$(s, s') \in R \implies (\sigma(s), \sigma'(s')) \in \overline{B}R$$

Bisimilar states are behaviorally equivalent. But not always the other way around!

# Modal logic

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \exists v \in \sigma(w) : \mathfrak{M}, v \Vdash \phi$$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$\mathfrak{M}, w \Vdash \Diamond\phi$  iff  $\sigma(w)$  has property  $\lambda_\Diamond[\phi]$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$\mathfrak{M}, w \Vdash \Diamond\phi$  iff  $\sigma(w)$  has property  $\lambda_\Diamond(\llbracket\phi\rrbracket)$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

where  $\lambda_\Diamond : P \rightarrow PB$  is given by

$$\lambda_\Diamond(U) := \{(A, V) \mid U \cap V \neq \emptyset\}$$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

where  $\lambda_\Diamond : \check{P} \rightarrow \check{P}B$  is given by

$$\lambda_\Diamond(U) := \{(A, V) \mid U \cap V \neq \emptyset\}$$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

where  $\lambda_\Diamond : \check{P} \rightarrow \check{P}B$  is given by

$$\lambda_\Diamond(U) := \{(A, V) \mid U \cap V \neq \emptyset\}$$

Proposition letters are nullary modalities!

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

where  $\lambda_\Diamond : \check{P} \rightarrow \check{P}B$  is given by

$$\lambda_\Diamond(U) := \{(A, V) \mid U \cap V \neq \emptyset\}$$

Proposition letters are nullary modalities!  $\lambda_p : (\check{P})^0 \rightarrow \check{P}B$  is given by

$$\lambda_p(*) := \{(A, V) \mid p \in A\}$$

# Semantics of modalities

A Kripke model is a  $P(\text{Prop}) \times P(-)$ -coalgebra.

$$\mathfrak{M}, w \Vdash \Diamond\phi \text{ iff } \sigma(w) \in \lambda_\Diamond([\![\phi]\!])$$

where  $\lambda_\Diamond : \check{P} \rightarrow \check{P}B$  is given by

$$\lambda_\Diamond(U) := \{(A, V) \mid U \cap V \neq \emptyset\}$$

Proposition letters are nullary modalities!  $\lambda_p : (\check{P})^0 \rightarrow \check{P}B$  is given by

$$\lambda_p(*) := \{(A, V) \mid p \in A\}$$

Then

$$\mathfrak{M}, w \Vdash p \text{ iff } \sigma(w) \in \lambda_p(*)$$

# Predicate liftings

Let  $B : \text{Set} \rightarrow \text{Set}$  be a behavior functor. An  $n$ -ary *predicate lifting* is a natural transformation

$$\lambda : (\check{P})^n \rightarrow \check{P}B$$

Examples:

# Predicate liftings

Let  $B : \text{Set} \rightarrow \text{Set}$  be a behavior functor. An  $n$ -ary *predicate lifting* is a natural transformation

$$\lambda : (\check{P})^n \rightarrow \check{P}B$$

Examples:

- Modal logic: we have a  $\square$  given by

$$\lambda_{\square} : U \mapsto \{(A, V) \mid V \subseteq U\}$$

# Predicate liftings

Let  $B : \text{Set} \rightarrow \text{Set}$  be a behavior functor. An  $n$ -ary *predicate lifting* is a natural transformation

$$\lambda : (\check{P})^n \rightarrow \check{P}B$$

Examples:

- Modal logic: we have a  $\square$  given by

$$\lambda_{\square} : U \mapsto \{(A, V) \mid V \subseteq U\}$$

- (Labeled) binary trees: functor is  $X \mapsto P(\text{Prop}) \times X \times X$ . We get a binary modality  $[\leftrightarrow]$  given by

$$\lambda_{\leftrightarrow}(U, V) = \{(A, x, y) \mid x \in U \text{ iff } y \in V\}$$

# Coalgebraic modal logic

$$\mathcal{L} ::= \neg\phi \mid \phi \vee \psi \mid \phi \wedge \psi \mid \langle \lambda \rangle(\phi_1, \dots, \phi_n)$$

where  $\lambda$  is an  $n$ -ary predicate lifting.

# Coalgebraic modal logic

$$\mathcal{L} ::= \neg\phi \mid \phi \vee \psi \mid \phi \wedge \psi \mid \langle \lambda \rangle(\phi_1, \dots, \phi_n)$$

where  $\lambda$  is an  $n$ -ary predicate lifting.

For modalities, the semantics is given by

$$[\![\langle \lambda \rangle(\phi_1, \dots, \phi_n)]\!]_{\sigma} := \check{P}_{\sigma} \circ \lambda([\![\phi_1]\!]_{\sigma}, \dots, [\![\phi_n]\!]_{\sigma})$$

# Coalgebraic modal logic

$$\mathcal{L} ::= \neg\phi \mid \phi \vee \psi \mid \phi \wedge \psi \mid \langle \lambda \rangle(\phi_1, \dots, \phi_n)$$

where  $\lambda$  is an  $n$ -ary predicate lifting.

For modalities, the semantics is given by

$$[\![\langle \lambda \rangle(\phi_1, \dots, \phi_n)]\!]_{\sigma} := \check{P}_{\sigma} \circ \lambda([\![\phi_1]\!]_{\sigma}, \dots, [\![\phi_n]\!]_{\sigma})$$

## Proposition

If  $f : (S, \sigma) \rightarrow (S', \sigma')$  is a morphism, then for all  $s \in S$  and all formulas  $\phi$ , we have

$$s \Vdash \phi \text{ iff } f(s) \Vdash \phi$$

# Coalgebraic modal logic

$$\mathcal{L} ::= \neg\phi \mid \phi \vee \psi \mid \phi \wedge \psi \mid \langle \lambda \rangle(\phi_1, \dots, \phi_n)$$

where  $\lambda$  is an  $n$ -ary predicate lifting.

For modalities, the semantics is given by

$$[\![\langle \lambda \rangle(\phi_1, \dots, \phi_n)]\!]_{\sigma} := \check{P}_{\sigma} \circ \lambda([\![\phi_1]\!]_{\sigma}, \dots, [\![\phi_n]\!]_{\sigma})$$

## Proposition

If  $f : (S, \sigma) \rightarrow (S', \sigma')$  is a morphism, then for all  $s \in S$  and all formulas  $\phi$ , we have

$$s \Vdash \phi \text{ iff } f(s) \Vdash \phi$$

## Corollary

If  $s \simeq s'$ , then  $s$  and  $s'$  are logically equivalent.

# Regular languages

Recall:  $BX = 2 \times X^A$ .

# Regular languages

Recall:  $BX = 2 \times X^A$ .

- Nullary lifting:

$$\lambda_{\checkmark}(*):=\{(i,u) \mid i=1\}$$

# Regular languages

Recall:  $BX = 2 \times X^A$ .

- Nullary lifting:

$$\lambda_{\checkmark}(*):=\{(i,u) \mid i=1\}$$

- For  $a \in A$ , a unary lifting

$$\lambda_a(U):=\{(i,u) \mid u(a) \in U\}$$

We get a translation  $m: A^* \rightarrow \mathcal{L}$  by

$$\epsilon \mapsto \langle \checkmark \rangle, \quad aw \mapsto \langle \lambda_a \rangle(m(w))$$

# Regular languages

Recall:  $BX = 2 \times X^A$ .

- Nullary lifting:

$$\lambda_{\checkmark}(*):=\{(i,u) \mid i=1\}$$

- For  $a \in A$ , a unary lifting

$$\lambda_a(U):=\{(i,u) \mid u(a) \in U\}$$

We get a translation  $m: A^* \rightarrow \mathcal{L}$  by

$$\epsilon \mapsto \langle \checkmark \rangle, \quad aw \mapsto \langle \lambda_a \rangle(m(w))$$

## Proposition

Let  $\sigma: S \rightarrow BS$  be a DFA. For  $s \in S$ , we have that  $s$  accepts  $w$  if and only if  $s \Vdash m(w)$ .

Thank you for listening!

## 1. Idea

A *coinductive definition* is a definition by coinduction.

## 2. Definition

See at [coinductive type](#).

# Coinductive definitions

My conclusion

Everything is a coinductive definition
