Part 0: Dataflow Programming

Motivation: Dataflow Programming

Dataflow programming is a paradigm for repeated processes: every declaration is a sequence of values.

$$fib = 0 \text{ FBY } (1 \text{ FBY WAIT } fib + fib)$$
$$nat = 0 \text{ FBY } (1 + nat)$$

- Elegant recursive dataflow syntax.
- Signal flow, 'trace-like' diagrams.
- Semantics: causal streams for the cartesian case.

E.g. Lustre, Lucid. Ashcroft, Wadge, 85

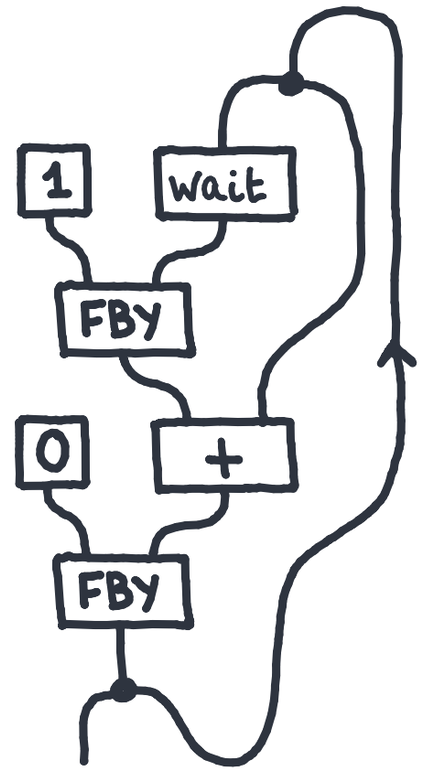

FIG. Signal flow graph.

Motivation: Dataflow Programming

Dataflow programming is a paradigm for repeated processes: every declaration is a sequence of values.

"followed by" "delayed stream"

```
fib = 0 FBY (1 FBY WAIT fib + fib)
nat = 0 FBY (1 + nat)
```

- Elegant recursive dataflow syntax.
- Signal flow, 'trace-like' diagrams.
- Semantics: causal streams for the cartesian case.

E.g. Lustre, Lucid.

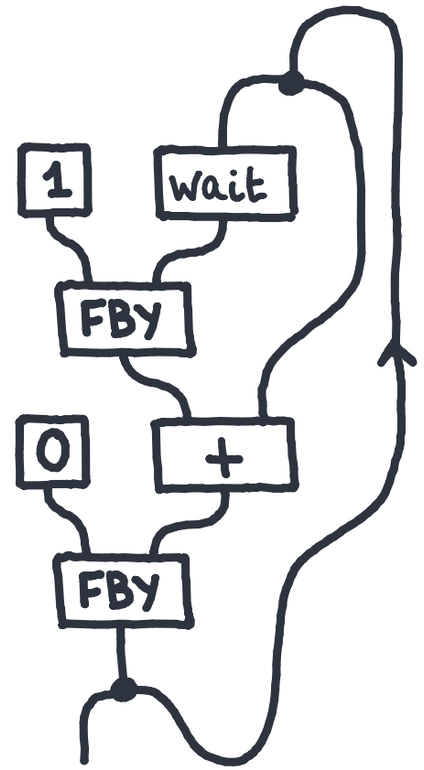

FIG. Signal flow graph.

Causal Stream Functions

DEFINITION. A causal stream function $f : \mathbb{X} \to \mathbb{Y}$ is a family of functions

$f_n : X_0 \times \cdots \times X_n \to Y_n$.

$f_0 : X_0 \to Y_0$
$f_1 : X_0 \times X_1 \to Y_1$
$f_2 : X_0 \times X_1 \times X_2 \to Y_2$
$\cdots$

These form a monoidal category, the cokleisli category of the non-empty list monoidal comonad,

$\mathrm{List}^+ : [\mathbb{N}, \mathrm{Set}] \to [\mathbb{N}, \mathrm{Set}]$, $\mathrm{List}^+(\mathbb{X})_n = \prod_{i=0}^{n} X_i$.

We have
- a delay functor taking $\mathbb{X} = (X_0, X_1, X_2, \ldots)$ into $\partial\mathbb{X} = (1, X_0, X_1, \ldots)$;
- a trace-like operator taking $\partial\mathbb{S} \otimes \mathbb{X} \to \mathbb{S} \otimes \mathbb{Y}$ into $\mathbb{X} \to \mathbb{Y}$;
- coalgebraic reasoning and coinductive arguments.

Uustalu, Vene Sprunger, Katsumata 19

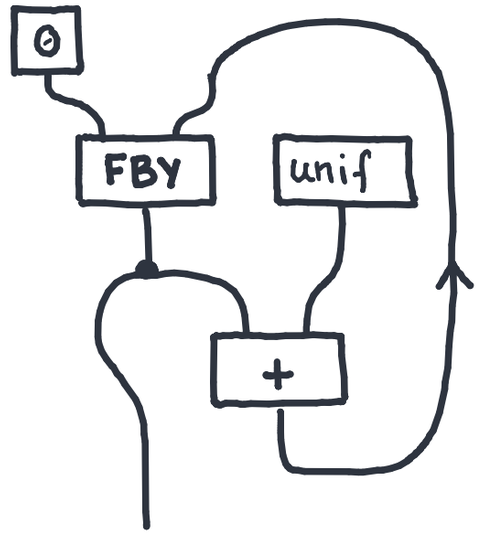
Monoidal Dataflow Programming

What about the non-cartesian case?

walk = 0 FBY UNIFORM {-1,1} + walk

We imagine what the syntax should be, but, what should replace streams in the semantics?

These will be monoidal streams.



Can we extend the comonad to monoidal categories? No. We need a different solution.

THEOREM (DLdFR). The non-empty list functor $\mathrm{List}^+(X)_n = \bigotimes_{i=0}^{n} X_i$ is a monoidal comonad if and only if $(\otimes)$ is a cartesian product.

Motivation

Today, given any symmetric monoidal category $(\mathbb{C}, \otimes, I)$, we will build a symmetric monoidal category of stream processes $\mathbf{Stream}(\mathbb{C})$ such that

- $\mathbf{Stream}(\mathbb{C})$ has an id-on objs functor from $[\mathbb{N}, \mathbb{C}]$;
- $\mathbf{Stream}(\mathbb{C})$ has a delay monoidal functor, ∂;
- $\mathbf{Stream}(\mathbb{C})$ has delayed feedback taking $\partial S \otimes X \to S \otimes Y$ into $X \to Y$;
- $\mathbf{Stream}(\mathbb{C})$ has a coalgebraic description;
- $\mathbf{Stream}(\mathbb{C})$ is cartesian when $\mathbb{C}$ is;
- $\mathbf{Stream}(\mathbf{Set})$ is the classical causal streams;
- $\mathbf{Stream}(\mathbf{Stoch})$ is causal discrete stochastic processes.
- $\mathbf{Stream}(\mathbb{C})$ is symm. premonoidal, effectful or Freyd when $\mathbb{C}$ is.

Three definitions in terms of universal properties, and three constructions.

Synopsis

Three definitions from universal properties, and three explicit constructions.
Each one a quotient of the previous.

1. Intensional streams, a first naïve version. Fail to form a category.
2. Extensional streams, a free category with feedback.
3. Observational streams, definitive solution to a fixpoint equation.

Two known particular cases, and an avenue for more.

1. Cartesian monoidal streams $(\mathbf{Set}, \times)$ are causal functions
   (as in Uustalu-Vene, Sprunger-Jacobs).
2. Stochastic streams $(\mathbf{Kl}(\mathcal{D}), \times)$ are controlled stochastic processes
   (classical in the literature).
3. Kleisli streams of strong monads. Freyd categories in general.

Extra: implementing signal flow graphs and dataflow programs.

(Intensional)

Part 1: Monoidal Streams

Streams and Stream Functions

"A stream of types $\mathbb{A} = (A_0, A_1, A_2, \ldots)$ is an element of A_0 together with a stream of types $\mathbb{A}^+ = (A_1, A_2, A_3, \ldots)$."

$$S(\mathbb{A}) \cong A_0 \times S(\mathbb{A}^+).$$

Streams and Stream Functions

"A stream of types $\mathbb{A} = (A_0, A_1, A_2, \ldots)$ is an element of A_0 together with a stream of types $\mathbb{A}^+ = (A_1, A_2, A_3, \ldots)$."

$$S(\mathbb{A}) \cong A_0 \times S(\mathbb{A}^+).$$

By Adamek's Theorem, the candidate solution is

$$\lim_{n \in \mathbb{N}} (1 \leftarrow A_0 \leftarrow A_0 \times A_1 \leftarrow A_0 \times A_1 \times A_2 \leftarrow \cdots) = \prod_{n=0}^{\infty} A_n ;$$

and it is a solution, $A_0 \times \prod_{n=1}^{\infty} A_n \cong \prod_{n=0}^{\infty} A_n$.

Adámek, 74

Streams and Stream Functions

"A stream function from $\mathbb{X}=(X_0, X_1, X_2, \ldots)$ to $\mathbb{Y}=(Y_0, Y_1, Y_2, \ldots)$ is a function $X_0 \to Y_0$ communicating along a memory channel M with a stream function from $\mathbb{X}^+=(X_1, X_2, X_3, \ldots)$ to $\mathbb{Y}^+=(Y_1, Y_2, Y_3, \ldots)$."

$$T(\mathbb{X};\mathbb{Y}) = \sum_{M \in \mathrm{SET}} \hom(X_0, M \times Y_0) \times T(M \times X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

By Adamek's Theorem, the candidate solution is

$$\lim_{n \in \mathbb{N}} (1 \leftarrow \hom(X_0, Y_0) \leftarrow \hom(X_0, Y_0) \times \hom(X_0 \times X_1, Y_1) \leftarrow \cdots) = \prod_{n=0}^{\infty} \hom(X_0 \times \cdots \times X_n, Y_n);$$

Sprunger, Katsumata 19

Monoidal Streams

"A monoidal stream from $\mathbb{X}=(X_0, X_1, X_2, \ldots)$ to $\mathbb{Y}=(Y_0, Y_1, Y_2, \ldots)$ is a morphism $X_0 \to Y_0$ communicating along a memory channel M with a monoidal stream from $\mathbb{X}^+=(X_1, X_2, X_3, \ldots)$ to $\mathbb{Y}^+=(Y_1, Y_2, Y_3, \ldots)$."

$$T(\mathbb{X};\mathbb{Y}) = \sum_{M \in SET} \hom(X_0, M \otimes Y_0) \times T(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

By Adamek's Theorem, the candidate solution is

$$\lim_{n \in \mathbb{N}} \left(1 \leftarrow \sum_{M_0} \hom(X_0, M_0 \otimes Y_0) \leftarrow \sum_{M_0 M_1} \hom(X_0, M_0 \otimes Y_0) \times \hom(M_0 \otimes X_1, M_1 \otimes Y_1) \leftarrow \cdots\right) =$$

$$\sum_{M:[N,C]} \prod_{n \in \mathbb{N}} \hom(M_{n-1} \otimes X_n, M_n \otimes Y_n).$$

Monoidal Streams

DEFINITION (DLdFR). An (intensional) monoidal stream $\mathbb{X} \to \mathbb{Y}$ is a family of objects $M_0, M_1, M_2, \ldots$ and a family of morphisms $f_n : M_{n-1} \otimes X_n \to M_n \otimes Y_n$.

$$T(\mathbb{X}, \mathbb{Y}) = \sum_{M : [\mathbb{N}, \mathbb{C}]} \prod_{n \in \mathbb{N}} \hom(M_{n-1} \otimes X_n, M_n \otimes Y_n).$$

THEOREM (DLdFR). The set of monoidal streams, depending on inputs and outputs, is the terminal fixpoint of

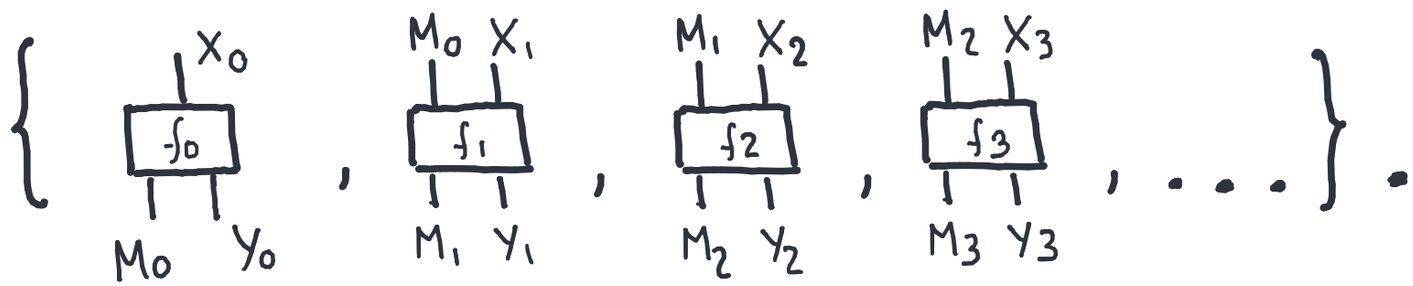
$$T(\mathbb{X}, \mathbb{Y}) = \sum_{M \in \mathrm{SET}} \hom(X_0, M \otimes Y_0) \times T(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

Monoidal Streams

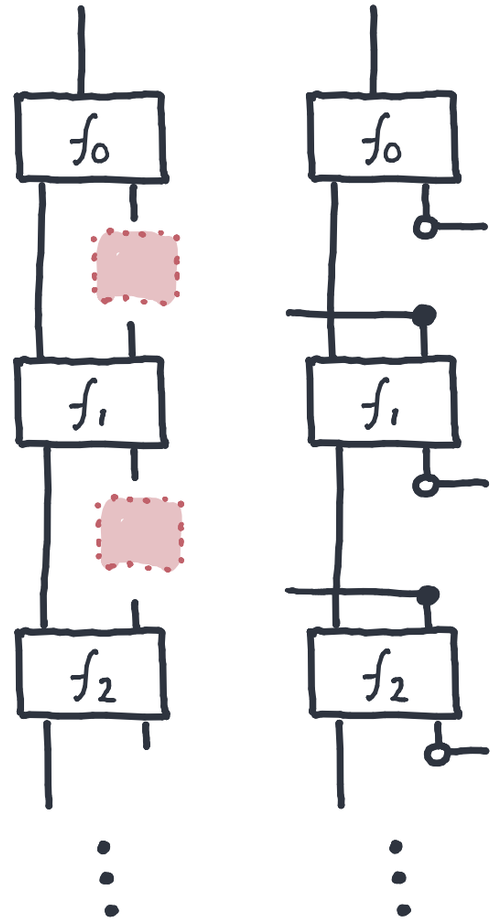
How to interpret a monoidal stream? In diagrams,

$(f_n : M_{n-1} \otimes X_n \to M_n \otimes Y_n)$

is



and yields the following "open diagram".



(Extensional)

Part 2 : Monoidal Streams

Extensional Streams

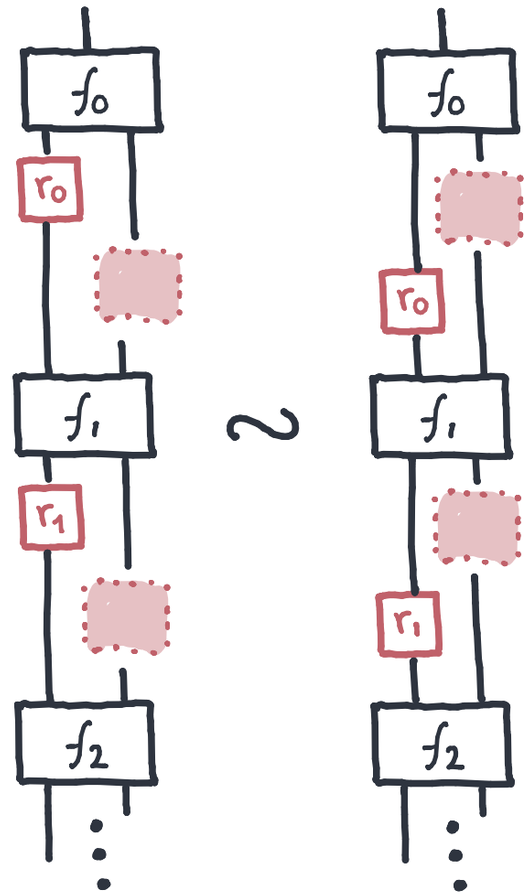
Monoidal streams are too explicit: e.g. having memories $M_n = A_n \otimes (B_n \otimes C_n)$ is different from having memories $M_n = (A_n \otimes B_n) \otimes C_n$. This makes them fail to form a category.

DEFINITION. An (extensional) monoidal stream is an equivalence class of intensional streams under the minimal equivalence relation containing $(\sim)$.

$$\sum_{M:[\mathbb{N},\mathbb{C}]} \prod_{n \in \mathbb{N}} \hom(M_{n-1} \otimes X_n, M_n \otimes Y_n) \Big/ \langle \sim \rangle$$

$$= \int^{M:[\mathbb{N},\mathbb{C}]} \prod_{n \in \mathbb{N}} \hom(M_{n-1} \otimes X_n, M_n \otimes Y_n)$$

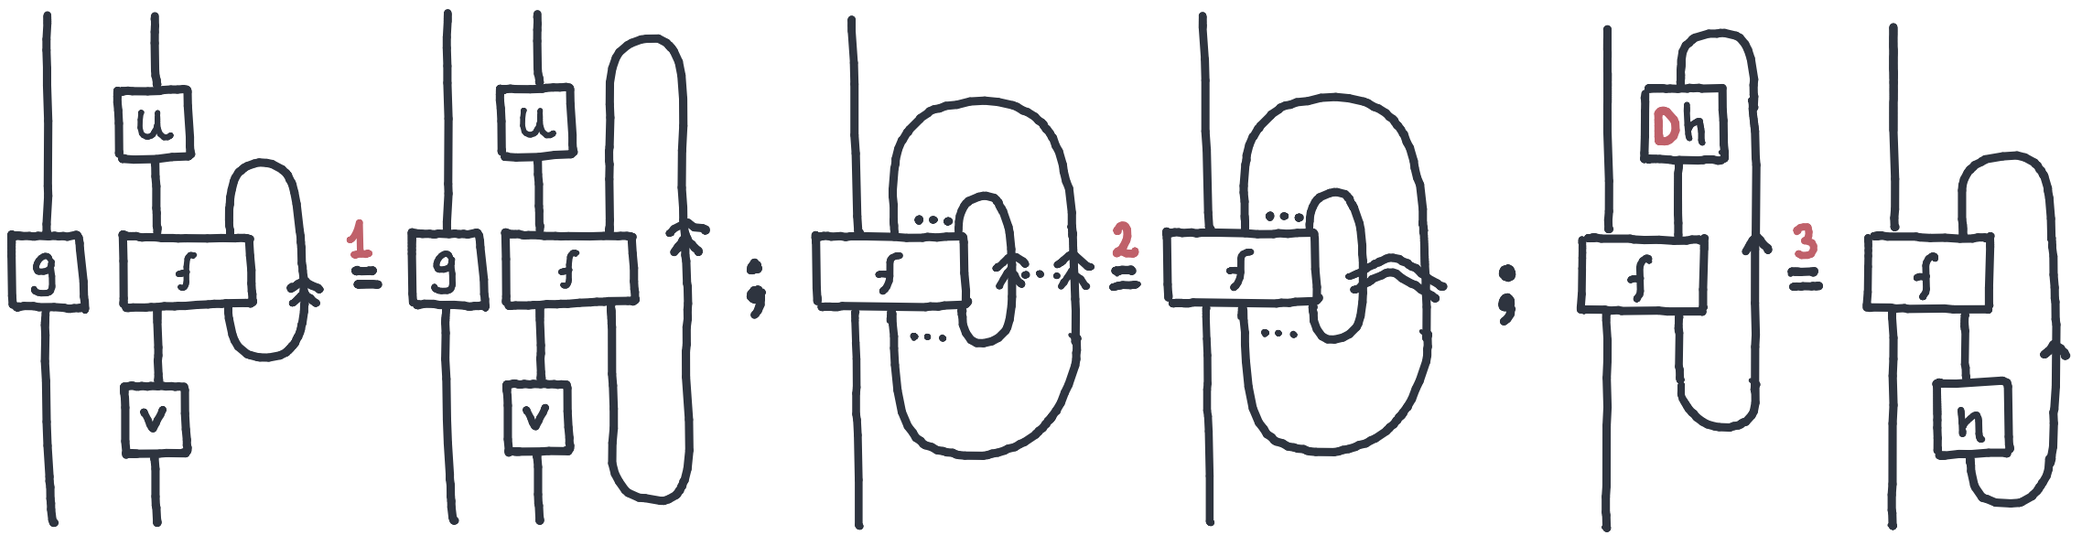
I like coends, but you may not; so let me justify them.



Feedback

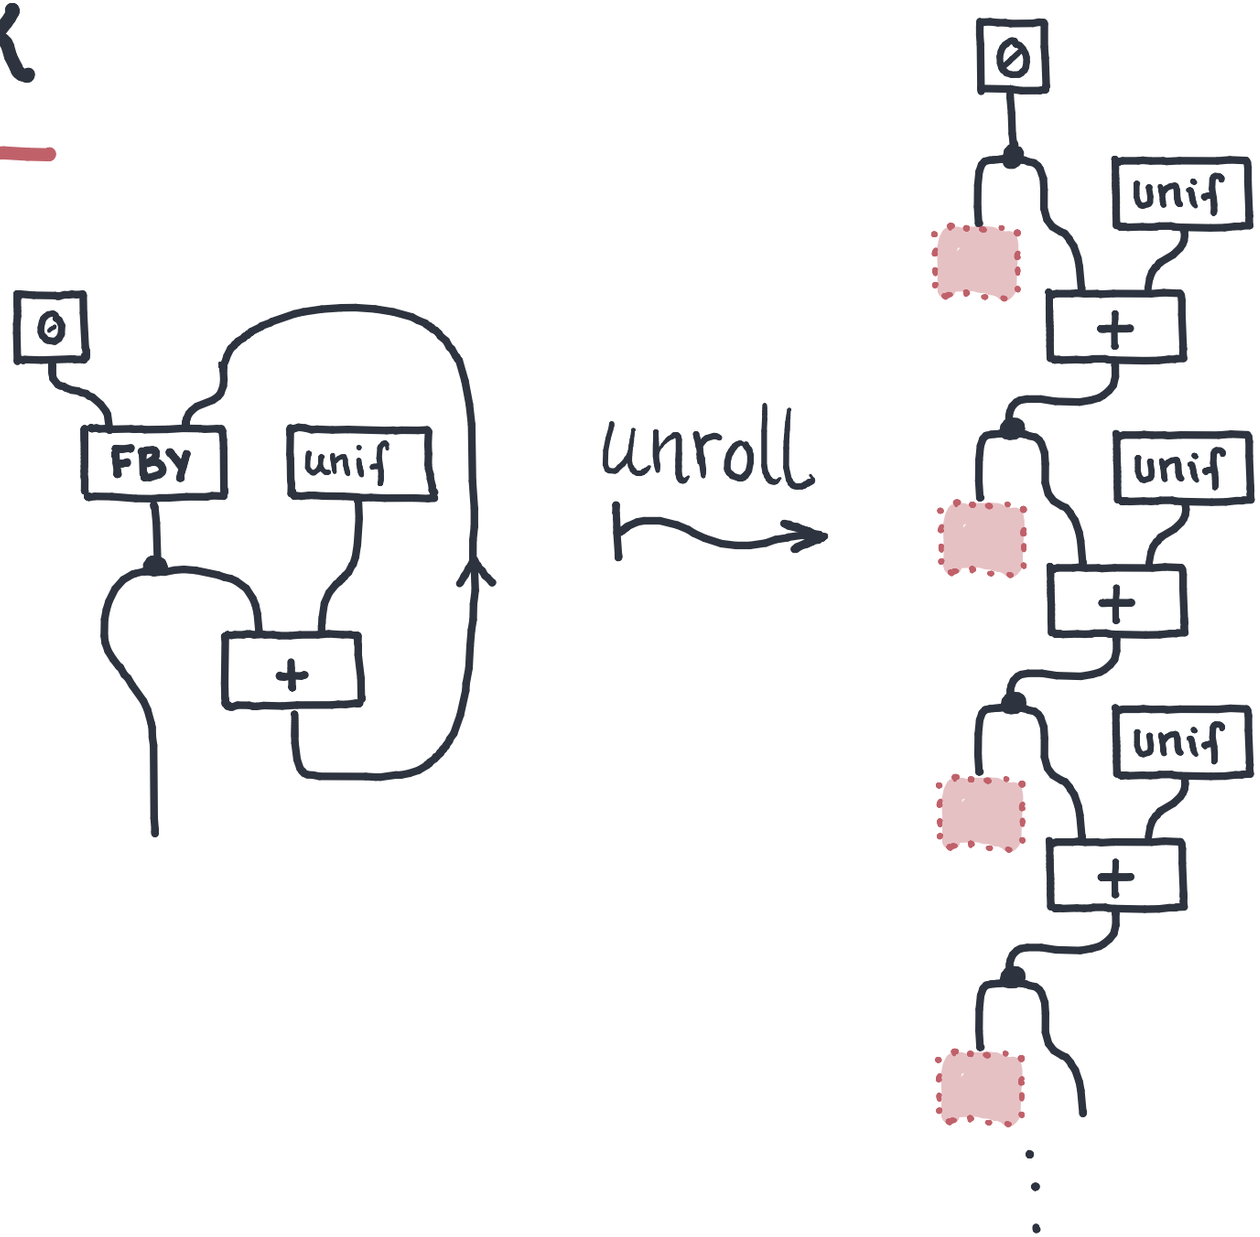
Feedback monoidal categories, Katis, Sabadini, Walters, axiomatize signal flow graphs using a guarded feedback operator $\mathrm{fbk} : \hom(DS \otimes A, S \otimes B) \to \hom(A, B)$.

Axioms.



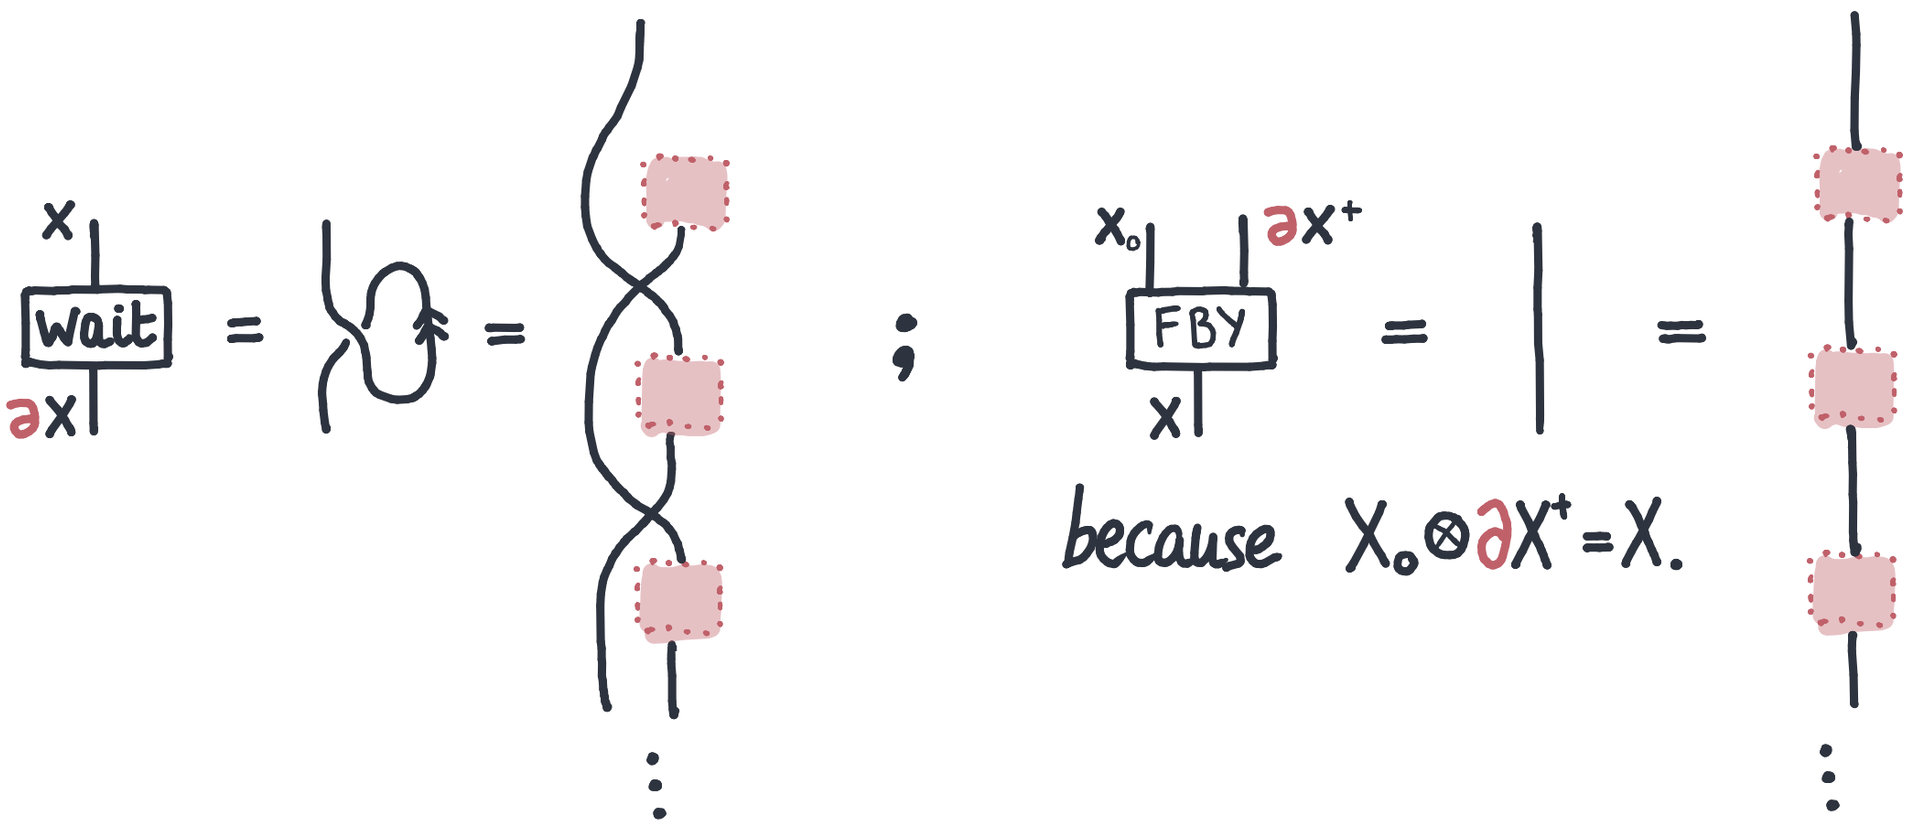
Theorem (DLdFR). Extensional streams are the morphisms of the free category with feedback over $\partial : [\mathbb{N}, C] \to [\mathbb{N}, C]$, $\partial(A_0, A_1, A_2, \ldots) = (I, A_0, A_1, \ldots)$.

Feedback



Feedback

Dataflow syntax can be derived from [N,C] and feedback.



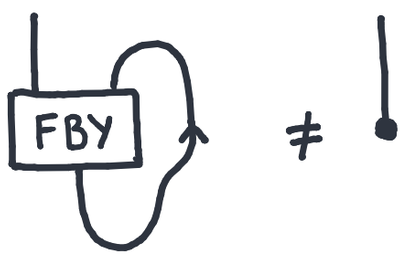
(Coinductive)

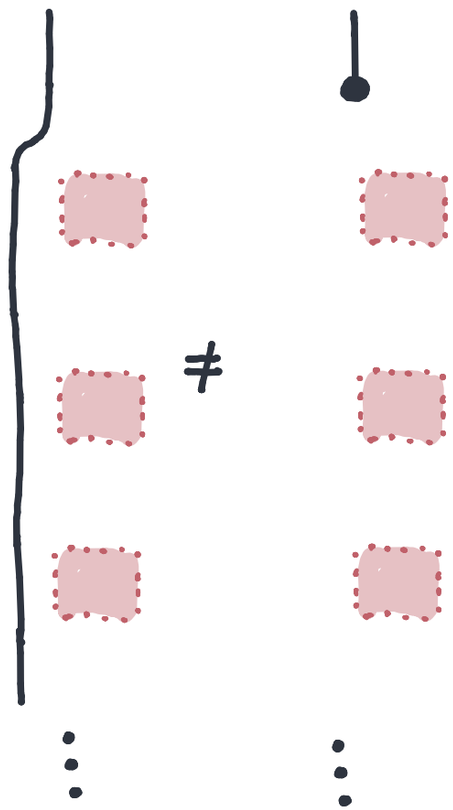
Part 3: Monoidal Streams

Observational Equivalence

So, we want, at least, extensional equivalence. Can we refine it?

Saving to memory without outputting is, observationally, the same as discarding. However, no amount of sliding will help us equating these two.





Two streams are observationally equal if their nth truncations can be made equal.

Coinductive Monoidal Streams

Reasoning with monoidal streams in well-behaved categories is easy: they are a final coalgebra.

THEOREM (DLdFR). Monoidal streams (with observational eq.) are the final coalgebra of

$$Q(X,Y) \cong \int^{M:\mathbb{C}} \hom(X_0, M \otimes Y_0) \times Q(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3 \ldots).$$

DEFINITION (DLdFR). A monoidal stream $f \in \mathrm{Stream}(X_0, X_1 \ldots; Y_0, Y_1, \ldots)$ is

- a memory $M(f) \in \mathbb{C}$
- a $\mathrm{now}(f) : X_0 \to M(f) \otimes Y_0$,
- and a $\mathrm{later}(f) \in \mathrm{Stream}(M \otimes X_1, X_2 \ldots; Y_1, Y_2, \ldots)$.

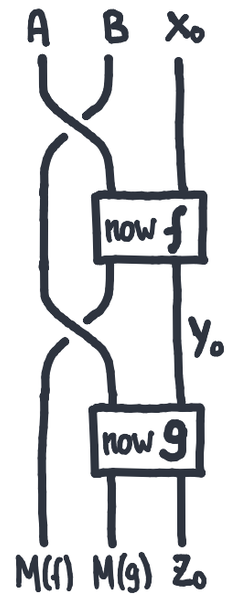
Quotiented by $f \approx g$, meaning

- the existence of $r : M(f) \to M(g)$,
- such that $\mathrm{now}(f); (r \otimes \mathrm{id}) = \mathrm{now}(g)$,
- and such that $\mathrm{later}(f) \approx r \cdot \mathrm{later}(g)$.

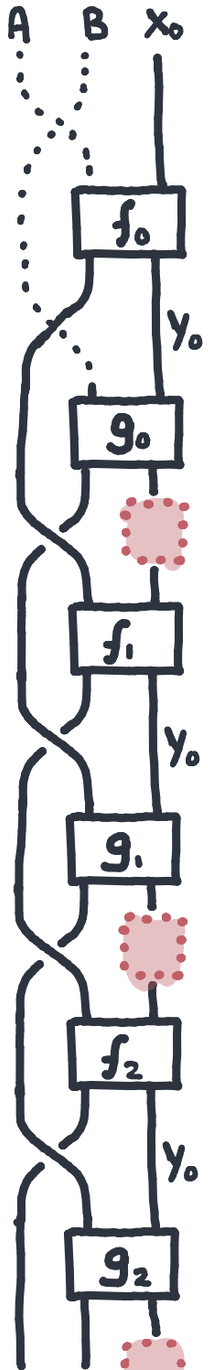
Coinductive Monoidal Streams

Sequential Composition **with memory** of $f \in \mathrm{Stream}(A \cdot X, Y)$ and $g \in \mathrm{Stream}(B \cdot Y, Z)$ is written as $(f \overset{A}{\triangleright} g^{B}) \in \mathrm{Stream}(A \otimes B \cdot X, Z)$, and defined by

- $M(f \overset{A}{\triangleright} g^{B}) = M(f) \otimes M(g)$;
- $\mathrm{later}(f \overset{A}{\triangleright} g^{B}) = \mathrm{later}(f)^{M(f)} \triangleright \mathrm{later}(g)^{M(g)}$, by coinduction;
- $\mathrm{now}(f \overset{A}{\triangleright} g^{B}) =$ •

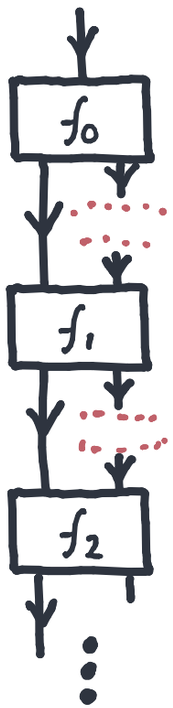


•

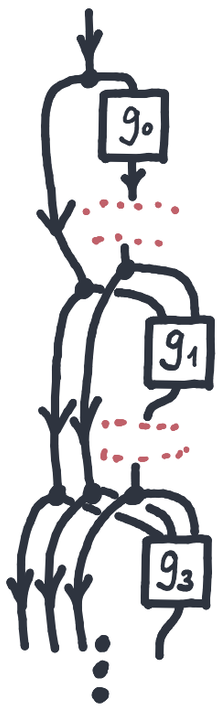


Part 4: Examples

Cartesian Monoidal Streams

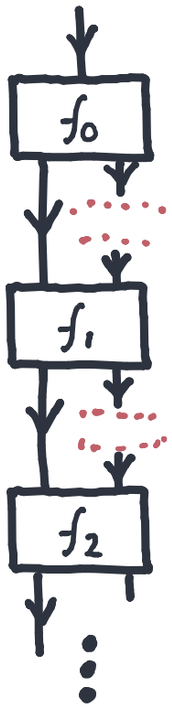


$$
\begin{aligned}
&S(X,Y)\\
&\cong \int^{M:\mathbb{C}} \hom(X_0, M\times Y_0) \times S(M\times X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).\\
&\cong \int^{M:\mathbb{C}} \hom(X_0, M\times Y_0) \times S(M\times X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots)\\
&\cong \int^{M:\mathbb{C}} \hom(X_0, M)\times\hom(X_0, Y_0) \times S(M\times X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots)\\
&\cong \hom(X_0, Y_0) \times S(X_0\times X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).
\end{aligned}
$$

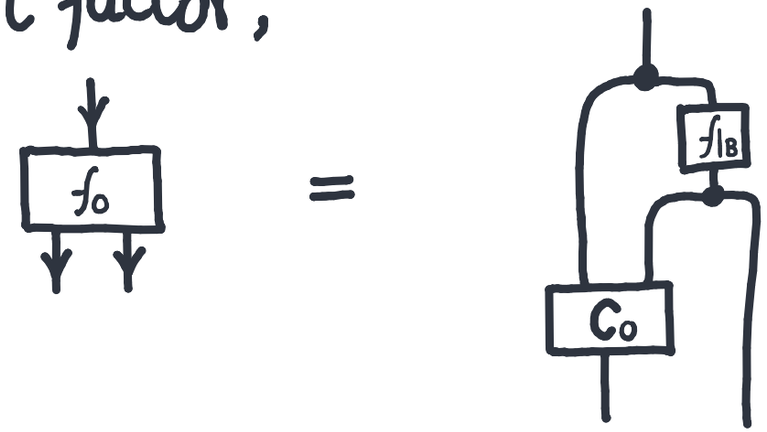


THEOREM. In cartesian monoidal categories, monoidal streams are causal stream functions.

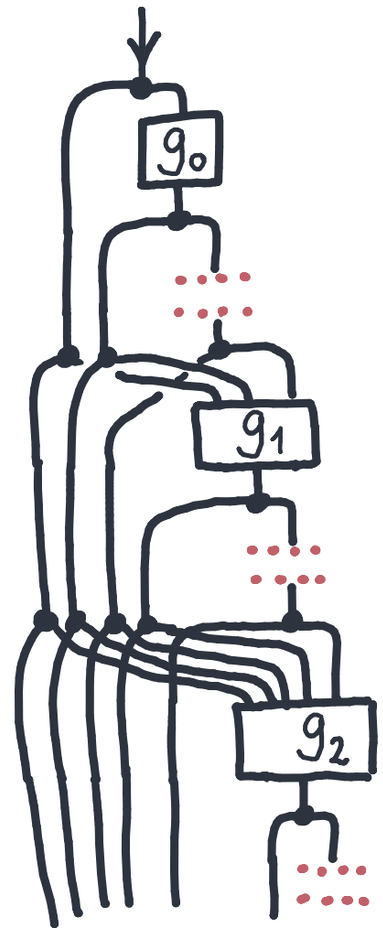
Stochastic Monoidal Streams



In Markov categories with conditionals, we can factor,



We use this to show that monoidal streams of stochastic functions are the same as controlled stochastic processes.



Stochastic Processes

DEFINITION. A **controlled stochastic process** $f : \mathbb{X} \to \mathbb{Y}$ is a family of stochastic functions $f_n : X_0 \times \cdots \times X_n \to D(Y_0 \times \cdots \times Y_n)$ satisfying

$$\begin{array}{ccc} X_0 \times \cdots \times X_{n+1} & \xrightarrow{f_{n+1}} & D(Y_0 \times \cdots \times Y_{n+1}) \\ {\scriptstyle n}\downarrow & & \downarrow{\scriptstyle D_n} \\ X_0 \times \cdots \times X_n & \xrightarrow{f_n} & D(Y_0 \times \cdots \times Y_n). \end{array}$$

causality: the future X_{n+1} should not influence the past $Y_0, \ldots, Y_n$.

THEOREM (DLdFR). Monoidal streams over $\mathrm{Kl}(D)$ coincide with controlled stochastic processes.

PROOF. Non trivial. Somehow, the causality condition means that the family can be written *uniquely* as a monoidal stream.

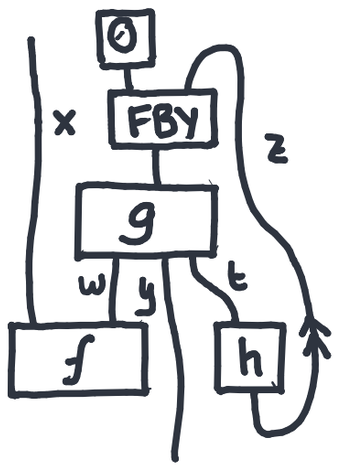
Extra : Implementation

Implementation

Type theory for sym. monoidal categories with feedback.



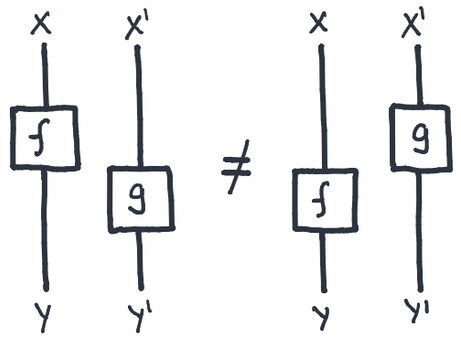
```
FBK z.
  SPLIT g(0 FBY h(z)) → [w,y,t] IN
  SPLIT f x w → [] IN
  RETURN y.
```

Obvious candidate: Haskell Arrows give notation for Set-based Freyd categories.

- ArrowLoop is for traced categories, in theory; it works for feedback.
- Github: mroman42/arrow-streams.

Premonoidal Categories

A sym. premonoidal category $(\mathbb{C}, \boxtimes, I)$ is a sym. monoidal category without the interchange law.



They usually have a family of "pure" morphisms that do satisfy interchange, forming a monoidal $\mathbb{V}$.

$$\mathbb{V} \longrightarrow \mathbb{C}$$

Pure — id-on-objects functor → Effectful

This is called a Freyd category.

Definition. The set of premonoidal streams in a Freyd category $\mathbb{V} \to \mathbb{C}$ is the final fixpoint of

$$Q(X,Y) \cong \int^{M:\mathbb{V}} \hom_{\mathbb{C}}(X_0, M \otimes Y_0) \times Q(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

Only pure morphisms should slide.

Theorem. If $\mathbb{V}$ is cartesian, and T is weakly cartesian then this final coalgebra is constructed by observational streams.

Extra : Coinduction

Coinductive Monoidal Streams

DEFINITION (DLdFR). A monoidal stream $f \in \mathrm{Stream}(X_0, X_1, \ldots; Y_0, Y_1, \ldots)$ is

- a memory $M(f) \in \mathbb{C}$
- a $\mathrm{now}(f) : X_0 \to M(f) \otimes Y_0$,
- and a $\mathrm{later}(f) \in \mathrm{Stream}(M \otimes X_1, X_2 \ldots; Y_1, Y_2, \ldots)$.

Quotiented by $f \approx g$, meaning

- the existence of $r : M(f) \to M(g)$,
- such that $\mathrm{now}(f); (r \otimes \mathrm{id}) = \mathrm{now}(g)$,
- and such that $\mathrm{later}(f) \approx r \bullet \mathrm{later}(g)$.

Coinductive Monoidal Streams

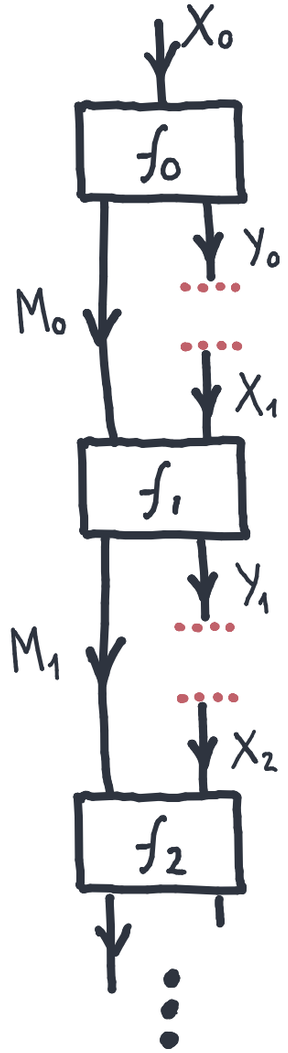
Reasoning with monoidal streams is easy: they are a final coalgebra.

$$S(\mathbb{X},\mathbb{Y}) \cong \int^{M:\mathbb{C}} \hom(X_0, M \otimes Y_0) \times S(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

Let me write $\mathbb{X} \in [\mathbb{N},\mathbb{C}]$ for $X_0, X_1, \ldots$; write $\mathbb{X}^+$ for $X_1, X_2, \ldots$; and write $M \cdot \mathbb{X}$ for $M \otimes X_1, X_2, X_3, \ldots$; the equation becomes

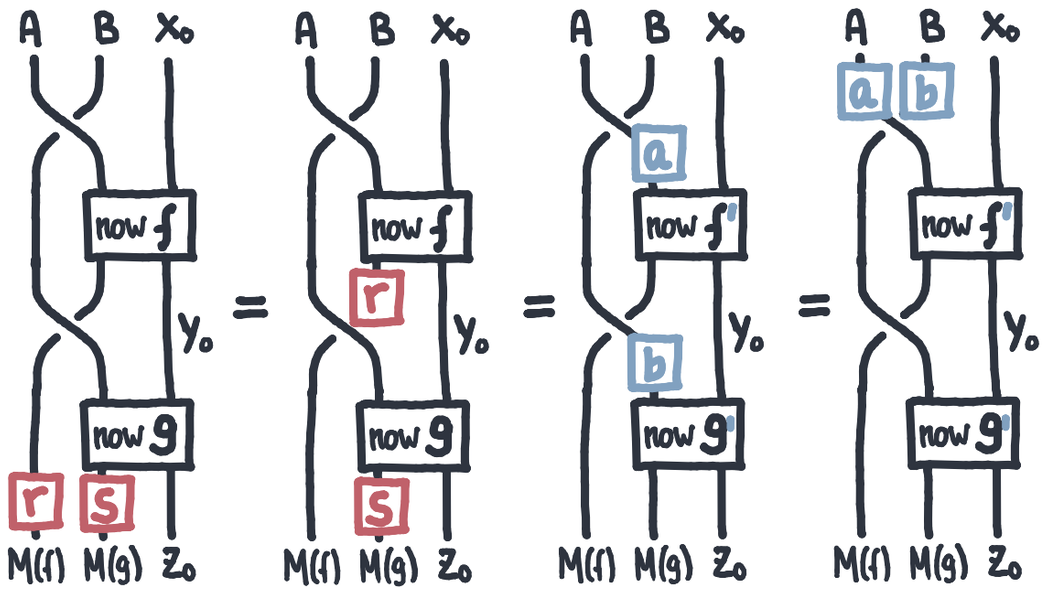
$$S(\mathbb{X},\mathbb{Y}) \cong \int^{M:\mathbb{C}} \hom(X_0, M \otimes Y_0) \times S(M \cdot \mathbb{X}^+; \mathbb{Y}^+).$$

The coend connects the M to the next step.



Coinductive Monoidal Streams

Sequential Composition is well-defined. Given generators $f \overset{r}{\approx} a \cdot f'$ and $g \overset{r}{\approx} b \cdot g'$, we can show that $(f^A ; g^B) \overset{r \otimes s}{\approx} (a \otimes b) \cdot (f'^{A'} ; g'^{B'})$.



By coinduction,

$$later(f)^{M(f)} \circ later(g)^{M(g)} \approx (r \otimes s) \cdot (later(f')^{M(f')} \circ later(g')^{M(g')}).$$

using $later(f) \approx r \cdot later(f')$, $later(g) \approx s \cdot later(g')$.

When $a = id_A$, $b = id_B$, we have $(f \overset{r}{\approx} f') \wedge (g \overset{s}{\approx} g') \Rightarrow f^A ; g^B \overset{r \otimes s}{\approx} f'^A ; g'^B$.

ALGEBRA

Extra : Observational Streams

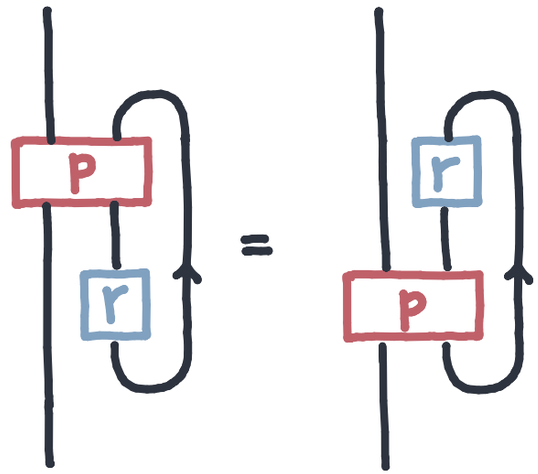
Process Interpretation

We think of functors $\mathbb{C}^{op} \times \mathbb{C} \to \mathrm{Set}$ as indexing families of processes, $P(M,N)$, by input M and output N. How to plug the output to the input?

Given $r : N \to M$,

- $P(id, r)(p) \in P(M,M)$, translate after reading,
- $P(r, id)(p) \in P(N,N)$, translate before writing.

These are "morally the same": dinaturally equivalent.



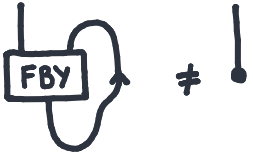
We write the set $\int^{X \in \mathbb{C}_{obj}} P(X,X)$ for $\sum_{X \in \mathbb{C}_{obj}} P(X,X)/\sim$, the coend of P,

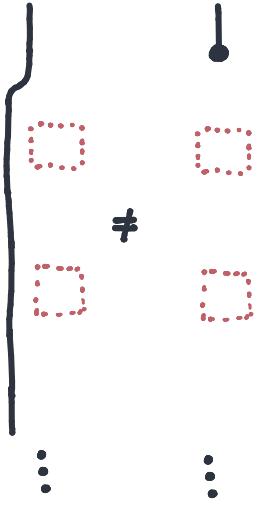
- $P(id, r)(p) \sim P(r, id)(p)$.

Observational Equivalence

So, we want, at least, extensional equivalence. Can we refine it?

Saving to memory without outputting is, observationally, the same as discarding. However, no amount of sliding will help us equating these two.





Observational Equivalence

So, we want, at least, extensional equivalence. Can we refine it?

DEFINITION. The nth-truncation of an extensional stream $\langle f_n \rangle$ is the first n components, up to any continuation.

Two streams are observationally equal if their nth truncations are equal. For instance,

This is not only a reasonable-sounding rule. This makes observational streams a canonical fixpoint.

Observational Streams

Intensional streams were the canonical fixpoint of the equation

$$T(X,Y) \cong \sum_{M \in \mathbb{C}} \hom(X_0, M \otimes Y_0) \times T(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

THEOREM (DLdFR). Observational streams, in reasonably well-behaved categories (productive) are the canonical fixpoint of the equation

$$Q(X,Y) \cong \int^{M : \mathbb{C}} \hom(X_0, M \otimes Y_0) \times Q(M \otimes X_1, X_2, X_3, \ldots; Y_1, Y_2, Y_3, \ldots).$$

Why not in all categories? You could craft a category where there is no way to go from X_0 to Y_0 without knowing the future!

I.e. there are infinitely descending chains for a Loebner-like order 
.

Observational Streams

Why not in all categories? You could craft a category where there is no way to go from X_0 to Y_0 without knowing the future! Adamek could fail.

$$\int^{M:\mathbb{C}} \hom(X_0, M \otimes Y_0) \times \lim^{n \in \mathbb{N}} \int^{M_1,\ldots,M_n} \prod_{i=1}^{n} \hom(M_{i-1} \otimes X_i, M_i \otimes Y_i)$$

$\cong$ ✓ fine

$$\int^{M:\mathbb{C}} \lim^{n \in \mathbb{N}} \int^{M_1,\ldots,M_n} \hom(X_0, M \otimes Y_0) \times \prod_{i=1}^{n} \hom(M_{i-1} \otimes X_i, M_i \otimes Y_i)$$

$\cong$ ✗ only discrete coproducts commute with connected limits

$$\lim^{n \in \mathbb{N}} \int^{M:\mathbb{C}} \int^{M_1,\ldots,M_n} \hom(X_0, M \otimes Y_0) \times \prod_{i=1}^{n} \hom(M_{i-1} \otimes X_i, M_i \otimes Y_i)$$

I.e. there are infinitely descending chains for a Loebner-like order 
.

Nothing to worry in semi cartesian, compact closed and freely generated monoidals.

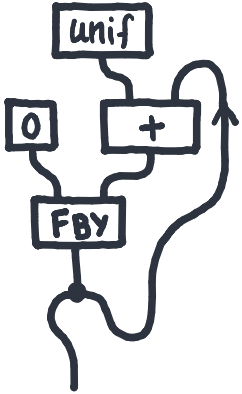
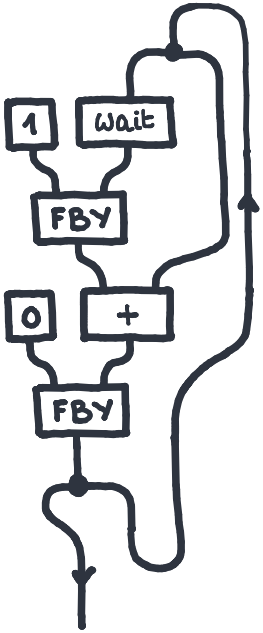
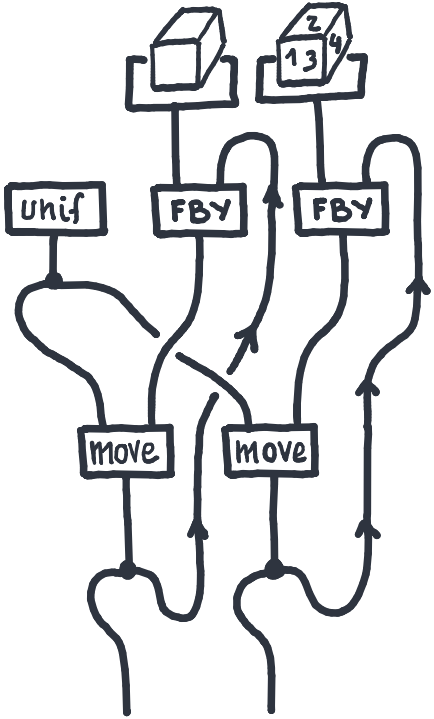
Examples







Extra : Lenses

Dinaturality and Coends

Given $P : \mathbb{C}^{op} \times \mathbb{C} \to \mathrm{SET}$, consider the set of all processes: $\sum_{X \in \mathbb{C}_{obj}} P(X,X)$.
Dinatural equivalence is the smallest equivalence relation generated by

$$P(id,r)(p) \sim P(r,id)(p).$$

We write the set $\int^{X \in \mathbb{C}_{obj}} P(X,X)$ for $\sum_{X \in \mathbb{C}_{obj}} P(X,X)/\sim$, the coend of P.

"The coend, $\int^{X \in \mathbb{C}_{obj}}$, connects both X's."

Motivation

In the process interpretation of monoidal categories, morphisms $A \to B$ are processes with an input A and an output B.

However, most processes (servers, drivers, agents,...) are continuously taking inputs and producing outputs,

closed diagram vs

open,[1] repeated[2] diagram.

Román.[1] Open Diagrams via Coend Calculus. ACT'20.

Román.[2] Comb Diagrams for Discrete-Time Feedback. Preprint.

Motivation

Lenses can be used to describe a single exchange,

$$\mathsf{Lenses}(A_0,A_1;B_0,B_1) = \int^{M} \hom(A_0, B_0\times M)\times\hom(M\times A_1, B_1) \cong \hom(A_0,B_0)\times\hom(A_0\times A_1, B_1)\,;$$

but "fixpointing" the exchange, we get causal stream functions.

$$\mathsf{Stream}(A;B) = \int^{M} \hom(A_0, B_0\times M)\times \mathsf{Stream}(M\cdot A^+;B^+) = \hom(A_0,B_0)\times\mathsf{Stream}(A_0\cdot A^+;B^+).$$

$$\mathsf{Stream}(A;B) \cong \mathsf{Optic}(\mathsf{Set}, \mathsf{Stream})((A_0,A^+);(B_0,B^+)).$$

Given the category Stoch of stochastic functions, the category of stochastic processes is the terminal fixpoint of

$$\mathsf{StochProc}(A;B) \cong \mathsf{Optic}(\mathsf{Stoch}, \mathsf{StochProc})((A_0,A^+);(B_0,B^+))$$

Extra : Expressivity

Expressivity

Orthogonal to the rest of the paper. What is the expressivity of the feedback syntax over some generators? The $St(\cdot)$ construction answers this.

- κ-Linear functions: hidden multivariable linear recurrence equations.

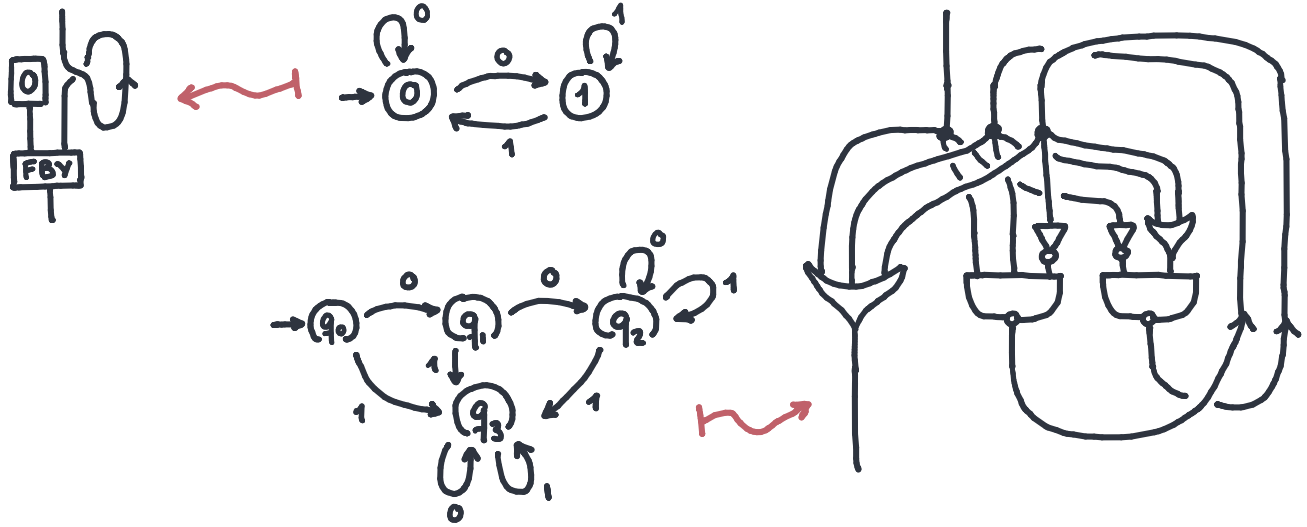
$$\begin{pmatrix} s_1 \\ \vdots \\ s_n \end{pmatrix}_{t+1} = \begin{pmatrix} \lambda_{11} & \cdots & \lambda_{1n} & \mu_{11} & \cdots & \mu_{1\kappa} \\ \vdots & & \vdots & \vdots & & \vdots \\ \lambda_{n1} & \cdots & \lambda_{nn} & \mu_{1n} & \cdots & \mu_{n\kappa} \end{pmatrix} \begin{pmatrix} s_1 \\ \vdots \\ s_n \\ a_1 \\ \vdots \\ a_\kappa \end{pmatrix}_t$$

$$\begin{pmatrix} b_1 \\ \vdots \\ b_n \end{pmatrix}_t = \begin{pmatrix} \varphi_{11} & \cdots & \varphi_{1n} & \psi_{11} & \cdots & \psi_{1\kappa} \\ \vdots & & \vdots & \vdots & & \vdots \\ \varphi_{n1} & \cdots & \varphi_{nn} & \psi_{1n} & \cdots & \psi_{n\kappa} \end{pmatrix} \begin{pmatrix} s_1 \\ \vdots \\ s_n \\ a_1 \\ \vdots \\ a_\kappa \end{pmatrix}_t$$

Expressivity

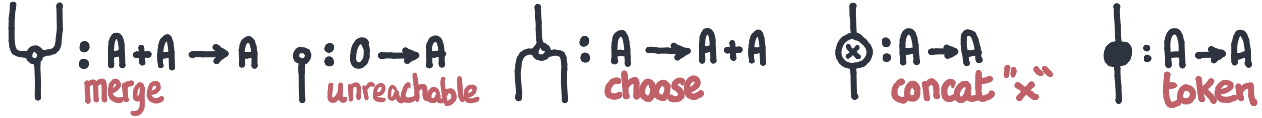
Orthogonal to the rest of the paper. What is the expressivity of the feedback syntax over some generators? The St(•) construction answers this.

- Boolean circuits: controlled deterministic automata (w/ boolean IO).

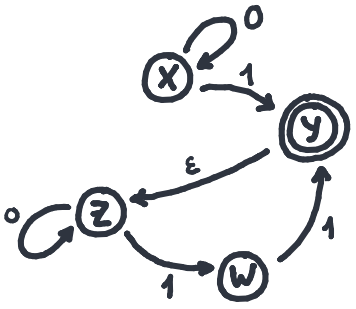


Expressivity

Monoidal streams over total relations can be interpreted as Büchi automata.



Example: $0^*1(0^*11)^\omega$



Park's equations.

$$X \Rightarrow 0X + 1Y$$
$$Y \Rightarrow Z$$
$$Z \Rightarrow 0Z + 1W$$
$$W \Rightarrow 1Y$$
